

Abstract of the Disclosure

A scooter folding structure includes a handle tube, a skateboard and a fastener device. The handle tube has a strut at a lower portion. The skateboard has a connecting block at a front end connected with the strut of the handle tube. The strut
5 includes a base having a boss extending upward. The connecting block comprises a pair of connecting parts at a distance with each other. Each connecting part has a position hole thereon. The connecting block has a pair of locating studs on one side thereof. The fastener device comprises a rod, a knob, and a spring. The rod is sleeved with the spring, and then inserted through the boss of the base of the handle tube and
10 connected with the knob. The rod has a threaded section threaded to the position hole of one of the connecting parts.
